```
ine piesent invention describes composition of indeced (1) is:

Ex domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where F1 = an FC domain; X1 and X2 = are each
independently selected from -(L1)c-F1, -(L1)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P3-(L4)f-P4
where P1, P2, P3, and P4 = are each independently sequences of
pharmacologically active peptides; L1, L2, L3, and L4 = are each
independently linkers; and a, b, c, d, e, and f = are each independently
cc independently linkers; and a, b, c, d, e, and f = are each independently
cc or 1, provided that at least 1 of a and b is 1. The composition can
cartivities. DNAs, vectors and host cells from the present invention can
cc be used for producing pharmaceutical compositions. The compositions are
cc useful for treating cancer, asthma, thrombosis, or autoimmune diseases.
CC The use of an FC domain (rather than a Fab domain) can provide a longer
cc half-life or incorporate functions such as Fc receptor binding, protein
A binding, complement fixation, and possibly placental transfer. AAA69443
cc sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker.
                                                                                                                   The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
         Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      'note= "optionally linked to an Fc molecule"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "optionally linked to an Fc molecule"

The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an FC domain, X1 and X2 = are each independently selected from -(1)-C-F1-(L1)c-F2-(L3)e-F3.

-(L1)-P1-L2)d-P2-(L3)e-F^3, or -(L1)c-F1-(L2)d-P2-(L3)e-F3-(L4)f-F4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB1803 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAB17290
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
δλ
                                                                                                            The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-FI-(X2)b, where: FI = an FC domain; XI and X2 = are each independently selected from -(L1)C-F1-(L2)d-P2.

(L1)C-P1-(L2)d-P2-(L3)e-P^3, or -(L1)C-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2. P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently or producing pharmaceutical from the present invention can be used for producing pharmaceutical compositions. The compositions are used for producing pharmaceutical compositions. The compositions are be used for producing pharmaceutical composition. The compositions are useful for treating cancer asthma, thrombosis, or autoimmune diseases. The use of an FC domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as FC receptor binding, protein to AAA69556 and AAB16955 to AAB1803 represent uncelectide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention describes composition of matter (I) comprising an (X1)a-P1-(X2)b, where F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2.

(X1)a-P1-(L2)d-P2-(L3)e-P^3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (MPC-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (MPC-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (MPC-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (MPC-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (MPC-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (MPC-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (MPC-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (MPC-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (MPC-P1-(L3)e-P3-(L3)e-P3-(L4)f-P4 (MPC-P1-(L3)e-P3-(L3)e-P3-(L4)f-P4 (MPC-P1-(L3)e-P3-(L3)e-P3-(L4)f-P4 (MPC-P1-(L3)e-P3-(L3)e-P3-(L4)f-P4 (MPC-P1-(L3)e-P3-(L3)e-P3-(L4)f-P4 (MPC-P1-(L3)e-P3-(L4)f-P4 (MPC-P3-(L3)e-P3-(L4)f-P4 (MPC-P3-(L3)e-P3-(L4)f-P4 (MPC-P3-(L3)e-P3-(L4)f-P4 (MPC-P3-(L3)e-P3-(L3)e-P3-(L4)f-P4 (MPC-P3-(L3)e-P3-(L4)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L3)e-P3-(L4)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autofimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; inhibitor: erythropoietin; thrombopoietin; interleukin 1; vactotoxic; T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.
pharmacologically active peptides, useful for treating cancer and

The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: FC domain, where FI = an FC domain, XI and X2 = are each independently selected from -(L1)C-PI-(L1)G-P2, (L3)G-P2, (L4)F-P4, (L1)C-PI-(L2)G-P2, (L3)G-P3, or -(L1)C-PI-(L2)G-P2-(L3)G-P3-(L4)F-P4, where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a and b is 1. The composition can have eytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention are useful for treating cancer, asthma, thrombosis, or autoimmune diseases.

The use of an FC domain (rather than a Fab domain) can provide a longer can incorporate functions such as FC receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443

The present invention describes composition of matter (1) comprising an Fc domain, planmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1,C-P1-(L2)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P2-(L3)d-P3, or -(L1)C-P1-(L2)d-P2-(L3)d-P3-(L4)f-P4 where P1; P2, P3, and P4 = are each independently sequences of planmacologically active peptides; L1, L2, L3, and L4 = are each independently (0 or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive contivities. DNAs, vectors and host cells from the present invention can be usef for producing pharmaceutical compositions. The compositions are usef for producing pharmaceutical compositions. The compositions are usef for producing pharmaceutical compositions. The compositions are usef for producing pharmaceutical compositions. The compositions are usef for producing pharmaceutical compositions. The compositions are usef for producing pharmaceutical transfer. AAA69443

The use of an Fc domain (rather than a Fab domain) can provide a longer complement fixation, and possibly placental transfer. AAA69443

TO AAA69526 and AAB16955 to AAB18003 represent uncleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VBGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and

The present invention describes composition of matter (I) comprising an

```
Fc domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each
independently selected from -(L1)c-P1-(L2)d-P2.

(L1)c-P1-(L2)d-P2.

(L3)e-P3. and P4 = are each independently sequences of
pharmacologically active peptides; L1, L2, L3, and L4 = are each
independently linkers; and a, b, c, d, e, and f = are each independently
independently linkers; and a, b, c, d, e, and f = are each independently
independently linkers; and a, b, c, d, e, and f = are each independently
be used for provided that at least 1 of a and b is 1. The composition can
activities. DNAs, vectors and host cells from the present invention can
be used for producing pharmaceutical compositions. The compositions are
useful for treating cancer, asthma, thrombosis, or autoimmune diseases.
The use of an Fc domain (rather than a Feb domain) can provide a longer
half-life or incorporate functions such as Fc receptor binding, protein
A binding, complement fixation, and possibly placental transfer. AAA69443
                                                                                                                                                                                                                                                                                          A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each

where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can useful for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAAA69526 and AAB16955 to AAAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-F1-(L1)c-F1-(L2)d-F2. (-1)a-F1-(L2)d-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F2-(L3)a-F
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4, mimetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and

independently linkers; and a, b, c, d, e, and f = are each independently of or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18903 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fc domain, pharmacologically active peptides, and linkers. Where [T] is:

(X1)a-Fl-(X2)b, where: Fl = an Fc domain; X1 and X2 = are each independently selected from -(L1)C-Pl-(L1)G-P2, -(L3)G-P2, -(L3)G-P2, -(L3)G-P2, -(L3)G-P2, -(L3)G-P2, -(L3)G-P2, -(L3)G-P2, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(L3)G-P3, -(

have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer and fall-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Thrombopoietin, mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker; cyclic; linear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A compound which binds to an mpl receptor comprising a thrombopoietin mimetic peptide (TMP) dimer joined by a linker [TMP_1-(L_1)_nTMP_2], is new. TMP_1 and TMP_2 are amino acid sequences varying from at least 10 to 14 residues in length comprising x_2-x_{-1}, x_2-x_{-1},
                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "optionally modified by bromoacetyl or PEG"

X_2-x_1_3, X_2-x_1_4, X_1-x_1_0, X_1-x_1_1, X_1-x_1_2, X_1-x_1_3, and X_1-x_1_4. X_1 = I, A, V, L, S or R; X_2 = E, D, K or V; X_3 = G or A; or E; X_5 = T or S; X_6 = L, I, V, A or F; X_7 = R or K; X_8 = G, N, Or E; X_9 = W, Y or F; X_1_0 = L, I, V, A, F, W, or K; X_1_1 = A, I, V, L, F, G, S, or Q; X_1_1 = A, I, V, L, F, G, S, or Q; X_1_3 = R, K, Comprising 1 to 20 amino acids; and n = 0 or 1. The compounds bind to and activate the C-Mpl receptor which mediates the activity of endogenous thrombopoietin. The TMPs are useful for increasing the production of platelets or platelet precursors (e.g. megakaryocytes) in a mammal, which is useful for treatment of diseases which involve thombocytopenia, e.g. applacttc anaemia, immune thrombocytopenia (ITP), human immunodeficiency virus associated ITP, and systemic lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker; cyclic; linear.

```
A compound which binds to an mpl receptor comprising a thrombopoietin mimetic peptide (TMP) dimer joined by a linker [TMP_1-(L_1)_nTMP_2], is new. TMP_1 and TMP_2 are amino acid sequences varying from at least 10 to 14 residues in length comprising X_2 - X_1 = 0, X_2 - X_1 = 0, X_2 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 = 0, X_1 - X_1 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         platelets or platelet precursors (e.g. megakaryocytes) in a mammal, which is useful for treatment of diseases which involve thombocytopenia, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                aplastic anaemia, immune thrombocytopenia (ITP), human immunodeficiency virus associated ITP, and systemic lupus erythematosus.
                 production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoletin; thrombopoletin; interleukin i; cytotoxic real lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;

The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where: F1 = an FC domain; X1 and X2 = are each
independently selected from -(L1)c-P1-(L2)d-P2.

(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4
where P1, P2, P3, and P4 = are each independently sequences of
pharmacologically active peptides; L1, L2, L3, and L4 = are each
independently linkers; and a, b, c, d, e, and f = are each independently
of or 1, provided that at least 1 of a and b is 1. The composition can
have cytostatic, antiasthmatic, thrombolytic and immunosuppressive
activities. DNAs, vectors and host cells from the present invention can
be used for producing pharmaceutical compositions. The compositions are
useful for treating cancer, asthma, thrombosis, or autoimmune diseases.
The use of an FC domain (rather than a Fab domain) can provide a longer
naif-life or incorporate functions such as Fc receptor binding, protein
A binding, complement fixation, and possibly placental transfer. AAA69443
cto AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; mMP: inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    4 ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 42;

Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia

Example 2A; Page 48; 91pp; English.

gene encoding a thrombopoietin mimetic peptide (TMP), which was then fused in-frame to the Fc region of the human IgGl chain (see AAY96529). A compound which binds to an mpl receptor comprising a TMP dimer joined by a linker [TMP\_1 (L\_1)\_nTMP\_2], is new. TMP\_1 and TMP\_2 are amino acid sequences varying from at least 10 to 14 residues in Overlapping oligonucleotides were used to construct a synthetic

length comprising X.2-X.1_0, X.2-X.1_1, X.2-X.1_2, X.2-X.1_3, X.2-X.1_4, X.1-X.1_2, X.1-X.1_3, and X.1-X.1_4, X.1=1, A, X.1-X.1_2, X.1-X.1_3, and X.1-X.1_4, X.1=1, A, X.2-X.1_5, and X.1-X.1_4, X.1=1, A, X.2-X.1_5, and X.1-X.1_4, X.1=1, A, X.2-X.1_5, and X.1-X.1_4, X.1=1, A, X.4=P; X.2=T or S; X.6=L, I, V, A, F; M, Or F; X.2=0, N, or E; X.9=W, Y or F; X.1_0=L, I, V, A, F; M, or K; X.1_1=A, I, V, L, F, S, T, K, H, or E; X.1_2=A, I, V, L, F, S, T, K, H, or E; X.1_2=A, I, V, L, F, T, R, E, or G; L.1=1inker comprising 1 to 20 amino acids; and n=0 or 1. The compounds bind to and activate the c-Mp1 receptor which mediates the activity of endogenous thrombopoietin. The precursors (e.g. megakaryocytes) in a mammal, which is useful for thrombocytopenia (ITP), human immunodeficiency virus associated ITP, and systemic lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (x1)a\cdot F(1-(x2)b), where: F1 = an Fc domain; x1 and x2 = are each independently selected from - (L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4
                                                                                                                                                                                                                                                                                                                                                                        Gaps

where Pl, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently of or l, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (x,1)a+\Gamma(x,2)b, where: FI = an FC domain; XI and X2 = are each independently selected from - (Li)c-Pi, -(Li)c-Pi-(L2)d-P2, -(L3)d-P2-(L3)e-P3, or -(Li)c-Pi-(L2)d-P2-(L3)e-P3-(L4)f-P4
                                                                                                                                                                                                                                                                                                                                                                 4; Gaps

where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently 0 or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma. Hrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18035 to AAAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A compound which binds to an mpl receptor comprising a thrombopoletin mimetic peptide (TMP) dimer joined by a linker [TMP]-(L_1)_nTMP_2], is new. TMP_1 and TMP_2 are amino acid sequences varying from at least 10 to 14 residues in length comprising X_2^-X_1^-0, X_2^-X_1^-1, X_2^-X_1^-1, X_2^-X_1^-1, X_2^-X_1^-1, X_2^-X_1^-1, X_2^-X_1^-1, X_2^-X_1^-1, X_2^-X_1^-1, X_2^-X_1^-2, X_2^-X_1^-3, and X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-X_1^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3, X_2^-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunoglobulin; IgG1; Fc; thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anaemic; dermatological; immunosuppressive; anti-inflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of

ή:
                thrombopoietin. The TMPs are useful for increasing the production of platelets or platelet precursors (e.g. megakaryocytes) in a mammal, which is useful for treatment of diseases which involve thombocytopenia, e.g. aplastic anaemia, immune thrombocytopenia (ITP), human immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b. where F1 = an FC domain; X1 and X2 = are each independently selected from -(L1)c-P1. (L2)c-P2. (L3)c-P2. (L3)c-P2. (L3)c-P3, or -(L1)c-P1. (L2)d-P2-(L3)e-P3. (L3)c-P1. (L2)d-P2-(L3)e-P3. (L3)c-P1. (L2)d-P2-(L3)e-P3. (L3)c-P1. (L2)d-P2-(L3)e-P3-(L4)f-P4. There is an each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are
activate the c-Mpl receptor which mediates the activity of endogenous

useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer

```
The present invention describes composition of matter (1) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a<sup>-</sup>F1<sup>-</sup>(X2)b, where: FI = an FC domain; XI and X2 = are each independently selected from -(L1)C-P1, -(L1)C-P1-(L2)d-P2.

(L1)C-P1-(L2)d-P2.

(L3)d-P2-(L3)d-P3, or -(L1)C-P1, -(L2)d-P2-(L3)e-P3-(L4)F-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently inkers; and a, b, c, d, e, and f = are each independently inters; and a, b, c, d, e, and f = are each independently contingent in the composition can be explosited, antiasthmatic, thrombolytic and immunosuppressive cortivities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases.

The use of an FC domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443
half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                   Gaps

(X1)a-F1-(X3)b, where: F1 = an Fc domain; X1 and X2 = are each

(X1)a-F1-(X3)b, where: F1 = an Fc domain; X1 and X2 = are each

(L1)c-P1-(L2)d-P2-(L3)e-P-3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4

where P1, P2, P3, and P4 = are each independently sequences of

pharmacologically active peptides; L1, L2, L3, and L4 = are each
independently linkers; and a, b, c, d, e, and f = are each independently

of or provided that at least 1 of a and b is 1. The composition can

have cytostatic, antiasthmatic, thrombolytic and immunosuppressive

activities. DNAs, vectors and host cells from the present invention can

be used for producing pharmaceutical compositions. The compositions are

useful for treating cancer, asthma, thrombosis, or autoimmune diseases.

The use of an Fc domain (rather than a Fab domain) can provide a longer

half-life or incorporate functions such as Fc receptor binding, protein

A binding, complement fixation, and possibly placental transfer. AAA69443

to AAA69526 and AAB18955 to AAB1803 represent invention amino acid

sequences used in the exemplification of the present invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 193, Assequence 193, Assequence 193, Assequence 17, Assequence 185, Sequence 187, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Assequence 185, Ass

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
